

Previous work By MLN

This is my portfolio of major and minor works, for my personal clients as well as within companies I worked for. Some of the work is for my personal projects which would normally not get approval owing to time and budget constraints. The works are ordered by most involved to quick and dirty mockups done in a few hours. Please note that some works were done in collaboration as part of a team and not a solo effort. Please see my codepen for personal projects and explorations into mobile and my website: [MLN](#)

THE BIG PROJECTS

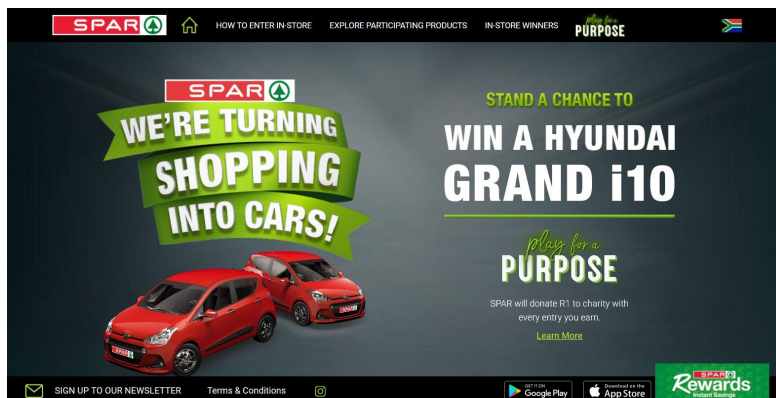

1. TRELLIDOR.COM - <https://trellidor.com/en-ZA>

A big overhaul project from a legacy website to using newer tech stack. Laravel is the MVC framework with a data API using a headless CMS (Wordpress). Actual UI implementation, custom animations and page transitions, mobile responsiveness and SEO were all developed and managed by the UI team of 3.

2. SPAR - <https://www.sparwinacar.co.za/>

Fun project using Vuejs and Laravel done by UI team of 2. Simple animations and using multiple libraries was eye opening and into the world of online game systems. FUN. Maintenance and delivery was on budget and on time.

3. CLARENDON - <http://www.clarendonschools.co.za/>

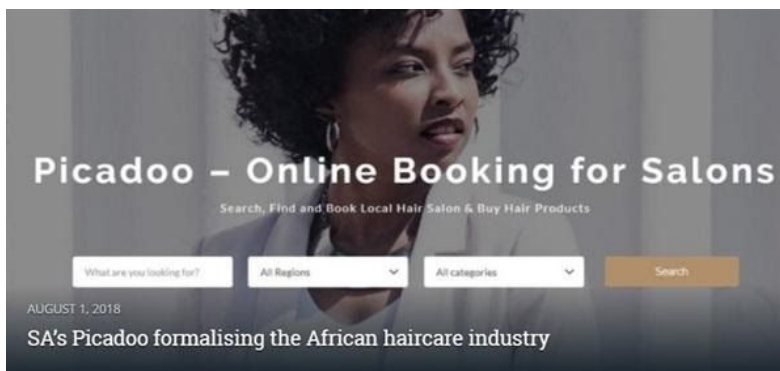

Clarendon Schools project was to use a headless CMS for Data layer, and Laravel for MVC framework. Animations, transitions, loaders, mobile responsiveness, Content management, were

all part of the package. Developed by UI team of 2. **Not** the smoothest of projects but a technically challenging one which was both insightful and fun.

4. PICADOO - <https://picadoo.co.za> (DEFUNCT STARTUP)

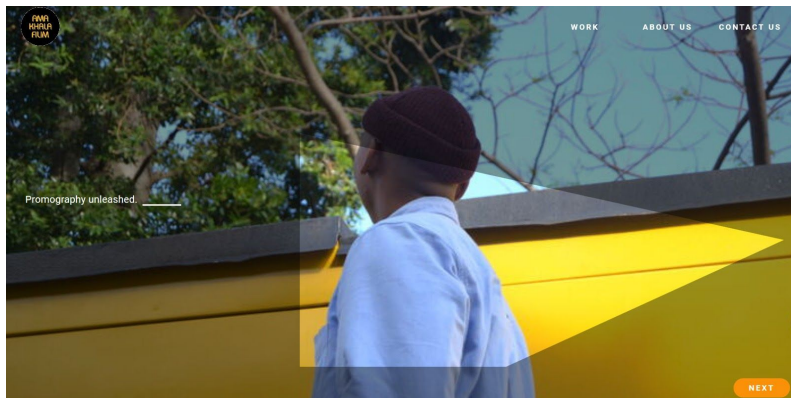

Please Google PICADOO and you will see that this startup was on the wings of great potential growth. Perhaps a little unfortunate, and timing a little off, the technology stack was very interesting. My role was more fullstack, so moved everything to Amazon web services(AWS) and some maintenance stuff to Azure. It was my first foray into a fully developed product for a VC funded company. Worked with AWS for a whole 2 years using EC2, lightsail (pre-lambda), Cloudflare addons, Security, S3, RDS, Cloudfront, OPSWORKS etc on a daily basis.

The smaller projects

1. AMAKHALA FILIM - www.amakhalafilim.co.za (Work in progress)

My current project which is not yet live. Developed by me in a matter of days. AKF is a company that does media and events related marketing. Celebrities, brands, events companies big and small. Very good business with good professionals and a more technical approach to marketing. Stack is HTML and CSS mostly with a sprinkling of Javascript for animations and transitions. IT is a One page website that uses modals, slides and transitions to make it feel bigger than it actually is.

2. My personal website - MLN (always a WIP)

Built with Flask and Bootstrap. Some libs like swiper as well. Data is from a headless CMS (Wordpress) for data. Includes a lot of micro and macro animations, explorations on transitions, and responsiveness. Also a flask backend means I can use jinja templating which is really powerful and really simple routing. No js Frameworks on this project as it would complicate adding and removing features.
